03 · PHILOSOPHY

For any $\varepsilon > 0$, there exists a $\delta > 0$.

The line is the formal definition of a limit, in seven characters. ε is the goal, the standard, the outcome the work has to clear. δ is the small enough step that lands inside it. The promise of the equation is that no matter how tight ε gets, a δ *exists*. The work is finding it, one increment at a time.

Meaningful change is reachable through deliberate, sufficiently small increments. Not by leaps. This is the mathematics of compounding, of Bayesian updating, of gradient descent, and of Buffett's investing discipline. Bring me a goal, bring me numbers, and I will find the smallest step that closes the gap.

THE LIMIT, FORMALLY

$$\forall \varepsilon > 0, \exists \delta > 0 : |x - a| < \delta \Rightarrow |f(x) - L| < \varepsilon$$

Cauchy / Weierstrass, 1820s. The discipline that turned calculus from intuition into proof.

ε

The goal the work has to clear

ε is the threshold. Define it before the work, not after. Numerically, where you can.

δ

The smallest step that reaches it

δ is the deliberate move that closes the gap. Small. Data-informed. The data names it; intuition rarely does.

$\exists$

There exists

The promise. A δ is out there. Stay open to the increment that finds it.

$\forall$

For any ε

Whatever standard you're held to. Tighten ε and the search begins again.

04 · HOW I WORK

Three beats. Always the same shape.

Every long-form piece, every recommendation, every decision follows the same three-beat structure. State the ϵ . Identify the δ . Show the data. The pattern does not need to be labeled. It needs to be felt.

Open by default. The notebook is shareable. The code is permissively licensed. The method travels with the result.

01

STATE THE ϵ

The goal, the tolerance, the desired outcome. Numerical where it can be.

02

IDENTIFY THE δ

The smallest deliberate move that closes the gap.

03

SHOW THE DATA

The evidence that informed the choice. Wins and nulls alike.

THEOREM · BRAND VOICE

Thm. Meaningful change is reachable in small enough increments.

Pf. Pre-register the goal. Find the smallest decisive move. Publish the result, including the null. Tighten ϵ . Repeat. ■

OPEN · BY DEFAULT

- open source. default permissive (MIT / Apache-2.0)
- open method. the recipe travels with the result
- open data. raw numbers, not just charts
- open notebook. the dead ends are part of the work

EXTENSION

For any $\epsilon > 0$, there exists a $\delta > 0$.
Find the δ .

the math is the system. extend it where the work calls for it.

05 · LENSES

Four lenses, one focal point.

Every field of training contributes a different kind of sight. Stacked, they converge on the same target. The δ that the data reveals. The work is the intersection.

CS

lens · 01

Architecture

Computer Science taught me how production systems are designed. Where the load lives. What breaks at scale.

MATH

lens · 02

Under the hood

Applied Math lets me read the model, not just call it. Gradients, distributions, error bounds. The things that make AI behave the way it does.

SECURITY

lens · 03

What others miss

A security background trains you to look for the failure modes nobody planned for. The risks others gloss over are usually where the real cost lives.

MBA

lens · 04

Prove the ROI

The finance lens turns conviction into evidence. Not 'this should pay off.' Instead: 'here is the discount rate, here is the payback period, here is the null.'

06 · TRANSITIONS

The pattern, twice.

This is the second major technology transition I've navigated. The first was cloud. I built the platforms that made it possible. Now it's AI. Same shape: skeptics, early infrastructure, the messy adoption middle, then the new default. The pattern is identical. The δ is just smaller this time.

Cloud, then AI. Same pattern, smaller δ .

The system, operationalized.

The three-beat structure is the operating model. Every feature is a hypothesis. Every release is a trial. Every metric review is a publication. The discipline that produces good math also produces good product.

01

STATE THE E

PMF assumption ·
feature bet

Name the specific belief. Write it as a falsifiable statement, not a goal.

02

PREDICT THE E

success metric ·
threshold

Pre-register what 'worked' looks like. Numerically. Before the test runs.

03

IDENTIFY THE Δ

MVP · A/B · pilot

Smallest decisive trial. Cheapest experiment that could disprove the hypothesis.

04

SHOW THE DATA

post-mortem ·
readout

Wins, nulls, and surprises. The null result is data. Kill it or scale it.

THEOREM · IN PRODUCT

Thm. A roadmap is a list of hypotheses, ranked by expected information.

Pf. Bets you already know the outcome of don't reduce uncertainty. Rank features by how much you'd learn from running them. Ship the cheapest decisive test first. ■

ARTIFACTS

- Pre-registered success metrics, written before launch.
- A 'kill criteria' line on every initiative.
- Null results published in the same room as wins.
- Decision logs. What we believed, what we learned.

08 · BIOS · TWO AUDIENCES

One person, two registers.

The brand is the system. Every surface is an application of it. Two audiences deserve two voices. Both true. Both signed by the same hand. GitHub speaks to engineers. LinkedIn speaks to operators. The math stays where it earns its keep.

GITHUB · TECHNICAL @amcheste

Engineer turned product leader · MBA candidate (ϵ , δ)

Product strategy at Oracle (OCI Operations). 15+ years across engineering, security, and platform PM. Built cloud platforms from the ground up: funding, teams, ship, adoption. Now applying the same pattern to AI infrastructure.

CS · Applied Math · Security · MBA → (ϵ , δ)

For any $\epsilon > 0$, there exists a $\delta > 0$. The notebook is open. Pull requests welcome.

AUDIENCE:
ENGINEERS

VOICE: TECHNICAL ·
OPEN

LINKEDIN · OPERATOR in/amcheste

Engineer turned product leader. Obsessed with efficiency.

I help businesses turn cloud and AI investments into measurable returns. 15+ years building and scaling enterprise software. I've led the cloud transition once. Built the platforms, drove the adoption, proved the ROI. Now I'm doing the same with AI.

What I bring: an engineer's instinct for what will actually work, a mathematician's eye for what the numbers really say, a security mindset for the risks others miss, and an MBA's discipline for proving the return. Bring me data and I'll entertain any hypothesis, including the one that tells us to pivot.

One obsession: efficiency that's *measured*, not assumed.

AUDIENCE: SMB
LEADERS

VOICE: PLAIN · RESULTS-
FIRST

RULE

Math notation only when the audience reads it natively. On every other surface, the obsession with efficiency speaks for itself.

09 · THE ACCENT

What hunter green means.

Hunter green is not decorative. It carries semantic meaning across every surface where the brand appears. It marks the δ , the moment of meaningful change in any narrative. Everything else stays in ink, paper, and graphite. The accent must be earned. When you see hunter green, something changed.

THE RULE

Hunter green = the data, the pivot, the δ .

unassuming first. depth on closer look. #1F4D3A.

IN A SENTENCE

rule · 01

Cloud, then AI. Same pattern, smaller margin.

On the noun that names the finding, not the description.

IN AN EQUATION

rule · 02

$\forall \epsilon > 0, \exists \delta > 0$

On ϵ , the goal the data has to clear. Not on δ . δ is the response, not the pivot.

IN A CHART

rule · 03

— baseline — **■** — after —

On the inflection point, the tick where the line bends. Never the line itself.

IN A NOTEBOOK

rule · 04

hyp · method · **result**

On the result column. The process is ink; the finding is hunter green.

DON'T

Decorate eyebrows, page numbers, dividers, or section tags. Don't tint headlines green. Don't use it for emphasis on opinions. If hunter green is on every page, the rule has been broken. If a green element doesn't represent **data, evidence, or a pivot**, demote it to ink.

The mark.

A wordmark and a monogram, both built from the same family. One for full attribution. One for compressed spaces. The ε between A and C is a quiet reminder of the source.

PRIMARY WORDMARK

alan chester.

HORIZONTAL LOCKUP

alan chester.

INVERSE

alan chester

MONOGRAM · SCALE

DO

Pair wordmark with monogram on a single horizontal axis.

DO

Hold ε's quiet weight. It should read once, then recede.

DON'T

Recolor the ε. The accent is reserved for system marks only.

11 · COLOR & TYPE

The system.

Deep neutrals, a single accent, an off-white. One sans for body, one mono for labels and metadata. Restraint is the strategy. The accent works because nothing else competes for attention.

DISPLAY · SANS

For any $\varepsilon > 0$

Body text. Used for proposals, correspondence, considered notes.

```
var(--ac-sans) · 500 / 400
```

LABEL · MONO

$\forall \varepsilon > 0, \exists \delta > 0$

V2026.04 · REF AC-0426

```
var(--ac-mono) · labels · math
```

TONE

precise

minimal

credible

experimental

open

rigorous

unhurried

How it sounds.

Calibrated, precise, restrained. Short sentences. Plain words for plain things. No hyperbole. No em dashes. Numerical specificity over round estimates. Math notation when it earns its keep, never as decoration. Quiet authority. The reader is smart and busy. Respect that.

- | | |
|--|--|
| ✓ For any $\epsilon > 0$, there exists a $\delta > 0$. | ✓ Coordination overhead dropped 23%. |
| × Synergistic, end-to-end excellence. | × Coordination overhead dropped significantly. |
| ✓ The data suggests we pause. | ✓ Find the δ . |
| × Maybe we should kind of pause. | × Game-changing breakthrough. |

SIGNATURE LINES

Every **goal** is an ϵ . Every **decision** is a δ . **Data** points the gradient.

The smallest deliberate **move**.

Find the **δ** .

Open by default. ■

13 · IN SUMMARY

One goal. One δ . Open by default.

The brand is the proof. Math is the system. Three beats are the structure.
Increments compound the result. Use ε as the anchor. Extend the structure where
the work calls for it.
